

## User Analysis

### Proposed Task

- Search Location
- Image Searching
- History Searching

### Persona

#### Persona 1 (User 1: Online Researcher)

John Chew, a 35 year old researcher who works for Tech Inc. He works endlessly as his work is vital to analyse and prepare reports to his clients and higher ups. With a busy schedule due to his work, he has to arrive early to his workplace to get the job done on schedule, but he often finds himself struggling to find the location due to some roads lack of specific signs and his weak sense of direction.

So, he seeks for a user-friendly app or website that can offer him access to real-time traffic information and accurate detailed maps based on mode of transport as well as clear display of search results with relevant details like distance and estimated travel time. This app or website should also include route optimization that can dynamically reroute based on current traffic conditions

Persona 2 ( user 2 : student )

Kevin, a 16 year-old student, is currently pursuing in Foon Yew High School. As a creative student, he is constantly working on design projects that require a large number of images to illustrate his ideas. However, he struggles to discover the appropriate image in a timely manner. Instead, the images he discovered online were invariably blurry, of poor quality, and sometimes contrary to his expectations. As a result, he is always required to work long hours in the library and studio till the completion of his assignments.

He intends to use an app or website that will allow him to accurately search for images. This website should incorporate image sharpness enhancements to ensure that all photos listed are clear enough for Kevin to use and streamline his workflow. In addition, the website should have a user-friendly interface that Kevin can easily navigate.

### Persona 3

Tauyee is a 57-year-old bonsai worker and a devoted environmental enthusiast. As a bonsai artist, he often seeks new ideas from the Internet to inspire his pot designs. However, middle-aged individuals in his age group might not be very proficient with web applications. Tauyee needs a simple, user-friendly app and website to facilitate his web browsing. In his daily life, Tauyee sometimes encounters great design ideas online but forgets to save them, making them difficult to retrieve later. This can result in the loss of valuable inspiration.

Therefore, he is looking for an app that makes it easy to find and revisit the sites he has browsed. The app should offer a rich content base, allowing him to gather inspiration from multiple sources. Moreover, as an environmental enthusiast, Tauyee wants to stay informed about global environmental protection efforts. He is particularly interested in updates on green planting initiatives, which can motivate him to contribute more to environmental conservation. Thus, the ideal app for Tauyee would be one that combines ease of use, a rich repository of creative content, and regular updates on environmental protection progress.

## **Scenario**

### **Task 1- Search Location**

John Chew, a researcher, had to find his way to his group project meeting as he is unfamiliar with UTM road. He used his phone and opened the Google app and started searching for desired location by clicking the search bar and entering the address. After that, he pressed "Search" to access the search results. He found the location successfully and he clicked on the "Directions" button to input his starting point in Google Map. As he planned his route, John adjusted the map details by selecting walking as his mode of transport and choosing the standard map view for clarity.

When he tried selecting the preferred map view, he was confused to choose his preferred map view since the icons for the terrain, satellite, and normal views were not clear to him. So, John decided to ask a friend for help. With his friend's guidance, he learned how to switch between map types and successfully navigated to his destination. This experience taught John the importance of clear and user-friendly design in apps, especially for new users like him.

### **Task 2: Image searching**

Kevin, a high school student, needs to find images of various rock formations for his science project. He opens the Google app and taps on the Google Lens icon. Kevin selects an image from his gallery that he took during a recent field trip to a national park. He browses through his device's photo gallery, carefully choosing the most representative image. After selecting the image, he clicks the search icon and waits for the results to appear. The app displays several related images and descriptions that match the rock formation in his photo.

Kevin carefully reviews the search results, checking each image for accuracy and relevance to his project. He analyses the search results, ensuring that the information meets his needs. Satisfied with the findings, Kevin saves the most informative images and their descriptions to his device for future reference. This process not only helps him gather accurate information but also improves his understanding of various rock types and their formations, which he will include in his project presentation. He appreciates the simplicity and effectiveness of the image search feature, although he thinks improving the sharpness of the pictures could be beneficial.

### **Task 3: History Searching**

Mr Tauyee, a passionate environment enthusiast, wants to revisit an article he read last month about sustainable farming practices. He opens the Google app on his phone and clicks on his profile picture to access his search history. Mr Tan scrolls through his recent searches, to look for the article. Since he can't immediately find it, he clicks the search icon within the history section, enters keywords related to the article, and clicks "Apply" to filter the results.

After applying the search filter, Mr Tauyee quickly locates the desired article among the filtered results. He clicks on the link to review the content and takes notes on key points that he plans to

discuss with his local community garden group. Mr Tan's ability to efficiently navigate his search history enables him to easily retrieve valuable information, helping him stay informed and engaged in his environmental advocacy efforts. However, he feels that categorising the search history by types of content would significantly improve the user experience by making it easier to browse through past searches. This task enhances his confidence in using the app's features to further his environmental interests and initiatives.
